simultaneous block-diagonal decomposition

- given: A_1, A_2, \dots, A_m — symmetric $n \times n$
- find: $P \in \mathbb{R}^{n \times n}$ — orthogonal

↓ simultaneous block diagonalization

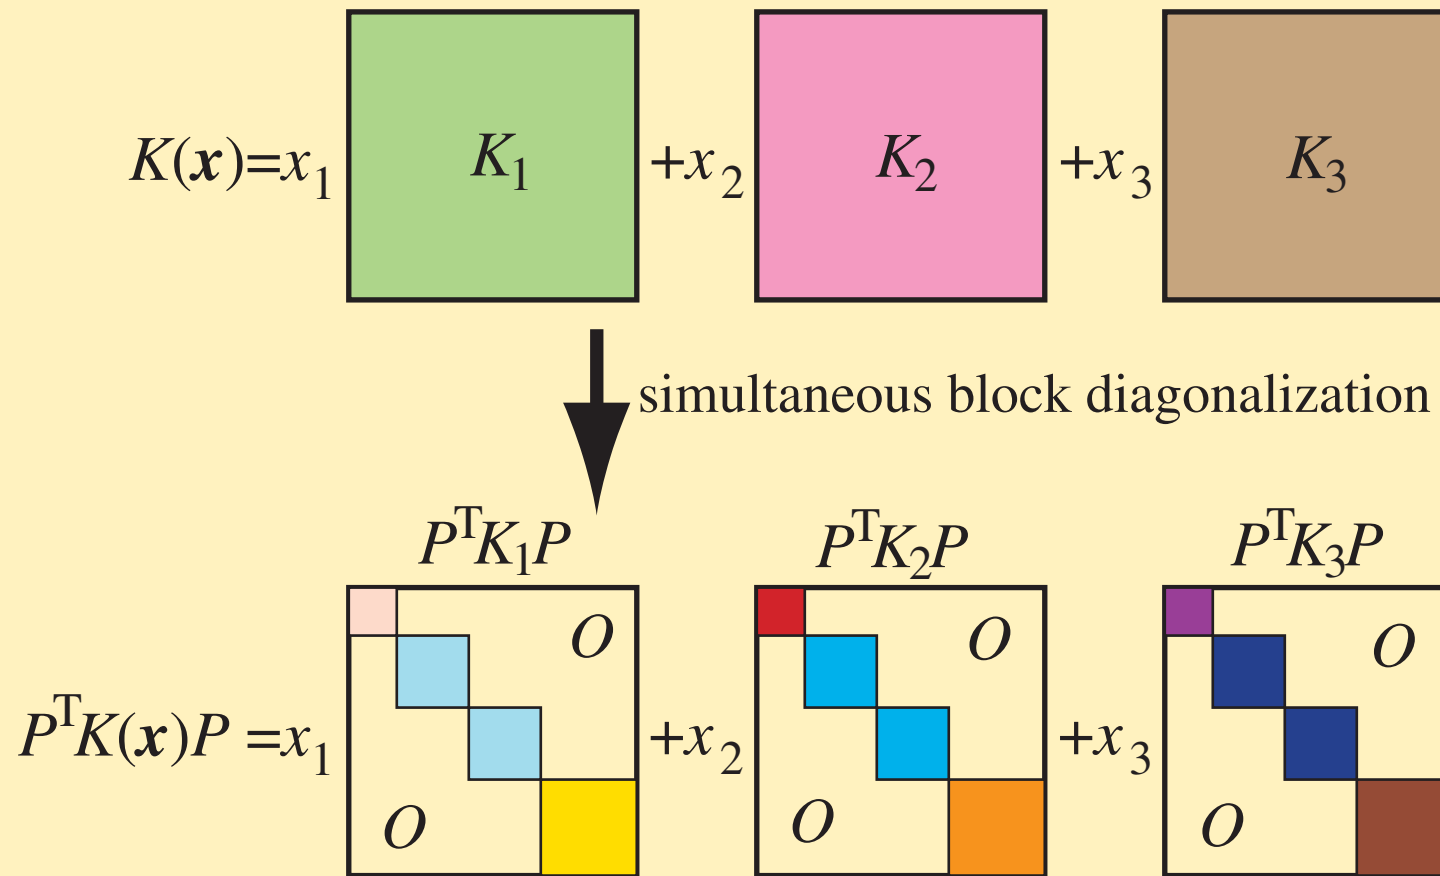

simultaneous block-diagonal decomposition: application

- $K(\mathbf{x})$: stiffness matrix \mathbf{x} : design variables
- given: K_1, K_2, \dots, K_m
- find: $P \in \mathbb{R}^{n \times n}$ — orthogonal

$$K(\mathbf{x}) = x_1 \begin{array}{|c|} \hline K_1 \\ \hline \end{array} + x_2 \begin{array}{|c|} \hline K_2 \\ \hline \end{array} + x_3 \begin{array}{|c|} \hline K_3 \\ \hline \end{array}$$

simultaneous block-diagonal decomposition: application

- $K(\mathbf{x})$: stiffness matrix \mathbf{x} : design variables
- given: K_1, K_2, \dots, K_m
- find: $P \in \mathbb{R}^{n \times n}$ — orthogonal

application: SDP

$$\begin{array}{ll} \min & \sum_{p=1}^m b_p y_p \\ \text{s.t.} & C - \sum_{p=1}^m A_p y_p \succeq O \end{array}$$

variables : y_1, \dots, y_m

coefficients : $b_1, \dots, b_m,$

$A_1, \dots, A_m, C \in \mathcal{S}^n$ $n \times n$ symmetric matrices

- $X \succeq O \iff X$ is positive semidefinite
← nonlinear but convex

application: SDP

$$\begin{aligned} \min \quad & \sum_{p=1}^m b_p y_p \\ \text{s.t.} \quad & C - \sum_{p=1}^m A_p y_p \succeq O \end{aligned}$$

- truss optimization (with eigenvalue constraints)

$$\begin{aligned} \min \quad & \text{vol}(\mathbf{x}) \\ \text{s.t.} \quad & \Omega_1(\mathbf{x}) \geq \bar{\Omega} \end{aligned}$$

can be solved by SDP [Ohsaki *et al.* 99] as

$$\begin{aligned} \min \quad & \mathbf{c}^T \mathbf{x} \\ \text{s.t.} \quad & \sum_{p=1}^m (K_p - \bar{\Omega} M_p) y_p \succeq O \end{aligned}$$

- optimization with buckling load factor constraints
- robust structural optimization

application: SDP

$$\begin{aligned} \min & \sum_{p=1}^m b_p y_p \\ \text{s.t.} & C - \sum_{p=1}^m A_p y_p \succeq O \end{aligned}$$

$$\begin{aligned} C^{(1)} - \sum_{p=1}^m A_p^{(1)} y_p &\succeq O \\ &\vdots \\ C^{(\ell)} - \sum_{p=1}^m A_p^{(\ell)} y_p &\succeq O \end{aligned}$$

application: SDP

$$\begin{aligned} \min & \sum_{p=1}^m b_p y_p \\ \text{s.t.} & C - \sum_{p=1}^m A_p y_p \succeq O \end{aligned}$$

- group theory

[Gatermann & Parrilo 04], [Bai & de Klerk 07] [de Klerk & Sotirov 07]

- matrix *-algebra [de Klerk, Pasechnik & Scrijver 07]

- **aim:** numerical algorithm

which can be executed **without** any knowledge of symmetry property in advance

matrix $*$ -algebra

$\mathcal{T} \subseteq \mathbb{R}^{n \times n}$ (set of $n \times n$ matrices)

is a **matrix $*$ -algebra**

- $I_n \in \mathcal{T}$
- If $A, B \in \mathcal{T}$, $\alpha \in \mathbb{R}$, then
 - ◆ $A + B \in \mathcal{T}$
 - ◆ $AB \in \mathcal{T}$
 - ◆ $\alpha A \in \mathcal{T}$
 - ◆ $A^T \in \mathcal{T}$

structure theorem

1. $\exists Q$: orthogonal s.t.

$$Q^T \mathcal{T} Q = \left[\begin{array}{c|c|c|c} S_1 & O & \cdots & O \\ \hline O & S_2 & O & O \\ \hline \vdots & O & \ddots & O \\ \hline O & O & \cdots & S_l \end{array} \right], \quad S_j \in \mathcal{T}_j : \text{simple}$$

2. If \mathcal{T}_j is simple, then $\exists \hat{P}$: orthogonal s.t.

$$\hat{P}^T \mathcal{T}_j \hat{P} = \left[\begin{array}{c|c|c|c} B_j & O & O & O \\ \hline O & B_j & O & O \\ \hline O & O & \ddots & O \\ \hline O & O & O & B_j \end{array} \right], \quad B_j \in \hat{\mathcal{T}}_j : \text{irreducible}$$

structure theorem: transformations to

- simple components

$\exists Q$: orthogonal, for any $A \in \mathcal{T}$,

$$Q^T A Q = \begin{array}{|c|c|} \hline \begin{array}{c} S_1 \\ \text{no common} \\ \text{eigenvalues} \end{array} & \begin{array}{c} O \\ \text{no common} \\ \text{eigenvalues} \end{array} \\ \hline \begin{array}{c} O \\ \text{no common} \\ \text{eigenvalues} \end{array} & \begin{array}{c} S_2 \\ \text{no common} \\ \text{eigenvalues} \end{array} \\ \hline \end{array}$$

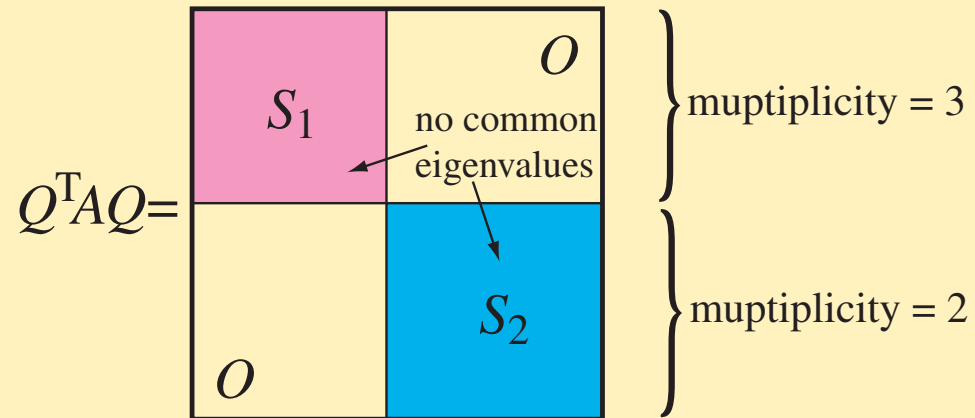

- & irreducible components

$\exists \hat{P}$: orthogonal, for any $A \in \mathcal{T}$,

structure theorem: transformations to

- simple components

$\exists Q$: orthogonal, for any $A \in \mathcal{T}$,

- & irreducible components

$\exists \hat{P}$: orthogonal, for any $A \in \mathcal{T}$,

algorithm (1)

input: A_1, A_2, \dots, A_m

1. Generate random r_1, \dots, r_m . Put $X \equiv \sum_{i=1}^m r_i A_i$.
2. Eigenvalue decomposition of X :

$$Q^T X Q = \left[\begin{array}{c|c|c|c} \alpha_1 I_{m_1} & O & O & O \\ \hline O & \alpha_2 I_{m_2} & O & O \\ \hline O & O & \ddots & O \\ \hline O & O & O & \alpha_k I_{m_k} \end{array} \right],$$

$$Q = [Q_1, Q_2, \dots, Q_k].$$

3. Compute $Q^T A_1 Q, \dots, Q^T A_m Q$.

algorithm (1)

input: A_1, A_2, \dots, A_m

1. Generate random r_1, \dots, r_m . Put $X \equiv \sum_{i=1}^m r_i A_i$.
2. Eigenvalue decomposition of X :
3. Compute $Q^T A_1 Q, \dots, Q^T A_m Q$.
4. Rearrange eigenvectors Q as

$$\hat{Q} = [Q[K_1], Q[K_2], \dots, Q[K_l]]$$

so that

$$\hat{Q}^T A_1 \hat{Q} = \begin{array}{|c|c|} \hline \text{pink} & 0 \\ \hline 0 & \text{blue} \\ \hline \end{array} \quad \hat{Q}^T A_2 \hat{Q} = \begin{array}{|c|c|} \hline \text{red} & 0 \\ \hline 0 & \text{orange} \\ \hline \end{array} \quad \dots$$

which is the decomposition to **simple components**.

algorithm (2)

input: $\hat{A}_1, \hat{A}_2, \dots, \hat{A}_m$ — simple

1. We know that the simple component is decomposed as

$$P^T \hat{A} P = \left. \begin{array}{c} \boxed{B} \\ \boxed{B} \\ \boxed{B} \end{array} \right\} \text{multiplicity} = 3$$

2. e.g. $B \in \mathbb{R}^{2 \times 2}$, $P^T \hat{A} P$ can be rearranged as

$$\tilde{P}^T \hat{A} \tilde{P} = \left[\begin{array}{c|c|c} b_{11}I & b_{12}I & b_{13}I \\ \hline b_{21}I & b_{22}I & b_{23}I \\ \hline b_{31}I & b_{32}I & b_{33}I \end{array} \right], \quad I = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}. \quad (\clubsuit)$$

We first find the transformation (\clubsuit).

algorithm (2)

input: $\hat{A}_1, \hat{A}_2, \dots, \hat{A}_m$ — simple

1. In order to obtain

$$\tilde{P}^T \hat{A} \tilde{P} = \left[\begin{array}{c|c|c} b_{11}I & b_{12}I & b_{13}I \\ \hline b_{21}I & b_{22}I & b_{23}I \\ \hline b_{31}I & b_{32}I & b_{33}I \end{array} \right], \quad I = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}, \quad (\clubsuit)$$

we use the form of

$$b_{ij} P_i P_j^T = \hat{A}_{ij}.$$

2. Put $P_1 = I$. Then,

$$b_{31} P_3 P_1^T = \hat{A}_{31} \implies P_3 = \hat{A}_{31} / b_{31}$$

$$b_{23} P_2 P_3^T = \hat{A}_{23} \implies P_2 = \hat{A}_{23} P_3 / b_{23}$$

algorithm (1) & (2)

- (1) simple components

$$\hat{Q}^T A_1 \hat{Q} = \begin{array}{|c|c|} \hline \text{pink} & 0 \\ \hline 0 & \text{blue} \\ \hline \end{array} \quad \hat{Q}^T A_2 \hat{Q} = \begin{array}{|c|c|} \hline \text{red} & 0 \\ \hline 0 & \text{orange} \\ \hline \end{array} \quad \dots$$

- (2) irreducible components

$$P^T A_1 P = \begin{array}{|c|c|c|} \hline \text{pink} & & 0 \\ \hline & \text{pink} & \\ \hline 0 & & \text{blue} \\ \hline & & & \text{blue} \\ \hline & & & & \text{blue} \\ \hline \end{array} \quad P^T A_2 P = \begin{array}{|c|c|c|} \hline \text{purple} & & 0 \\ \hline & \text{purple} & \\ \hline 0 & & \text{brown} \\ \hline & & & \text{brown} \\ \hline & & & & \text{brown} \\ \hline \end{array} \quad \dots$$

algorithm (1) & (2)

■ (1) simple components

$$\hat{Q}^T A_1 \hat{Q} = \begin{array}{|c|c|} \hline \text{pink} & O \\ \hline O & \text{blue} \\ \hline \end{array} \quad \hat{Q}^T A_2 \hat{Q} = \begin{array}{|c|c|} \hline \text{red} & O \\ \hline O & \text{orange} \\ \hline \end{array} \quad \dots$$

■ (2) irreducible components

$$P^T A_1 P = \begin{array}{|c|c|c|} \hline \text{pink} & & O \\ \hline & \text{pink} & \\ \hline O & & \text{blue} \\ \hline \end{array} \quad P^T A_2 P = \begin{array}{|c|c|c|} \hline \text{purple} & & O \\ \hline & \text{purple} & \\ \hline O & & \text{brown} \\ \hline \end{array} \quad \dots$$

■ advantages: algorithm uses

- ◆ only **linear algebraic computations** (e.g. eigenvalue decomposition)
- ◆ no knowledge of **algebraic structure (symmetry property)**
execution is free from **group representation theory**
or **matrix *-algebra**
